Centre of Experimental Physics,
Harbin Institute of Technology, Shenzhen

University Physics Experiments 1A (PHYS1002AE)

Introductory Lecture @ T3501, 18:45 - 21:35, 3rd March 2025

Ho-Kei Chan (陈浩基)
School of Science,
Harbin Institute of Technology, Shenzhen

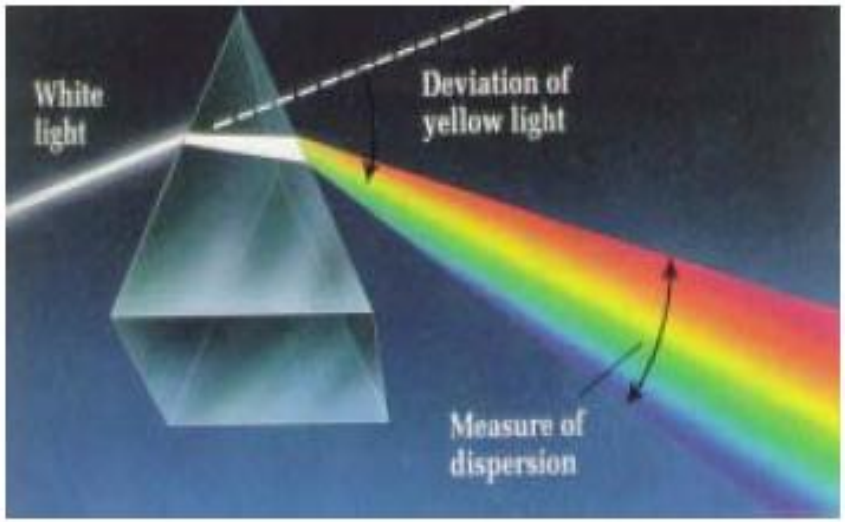

Email: hokeichan@hit.edu.cn

Outline

1. Course background
2. Course objectives
3. Course contents
4. Course arrangements
5. Course requirements
6. Errors and uncertainties in measurements
7. Significant figures of measured quantities
8. Methods of data analysis

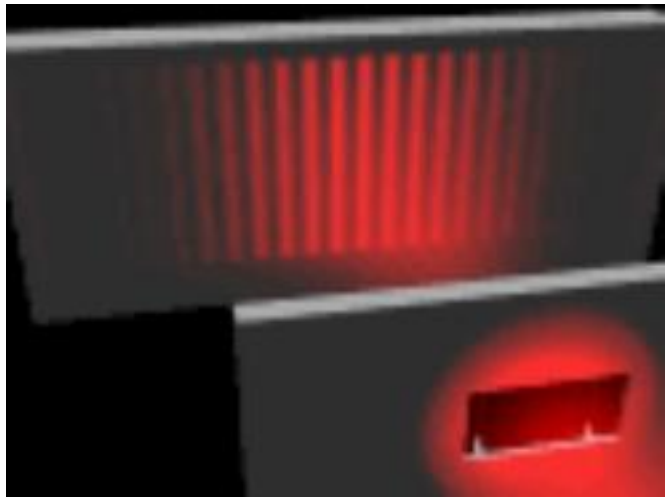

1. Course background

Experimental physics focuses on the acquisition and analysis of empirical data, with the aim to advance our knowledge and understanding of the physical world by confirming or disproving existing theories of physics. Here are some classic examples:

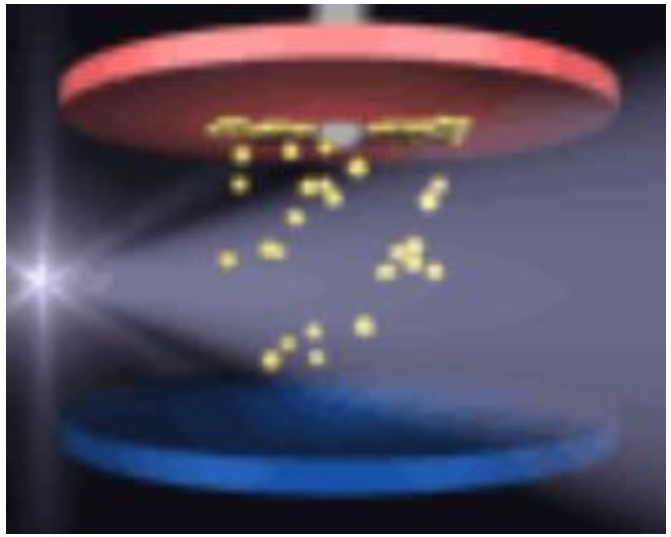

Newton's decomposition of sunlight with a prism (1665-1666), confirming that white light is composed of seven visible colors.

1. Course background

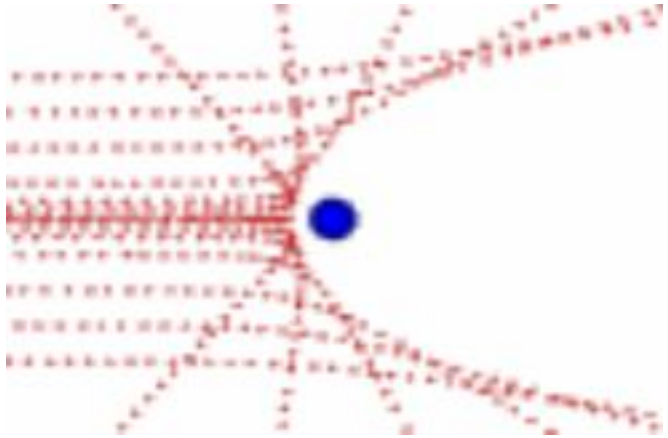

Young's light-interference experiment (1801), confirming the wave nature of light.

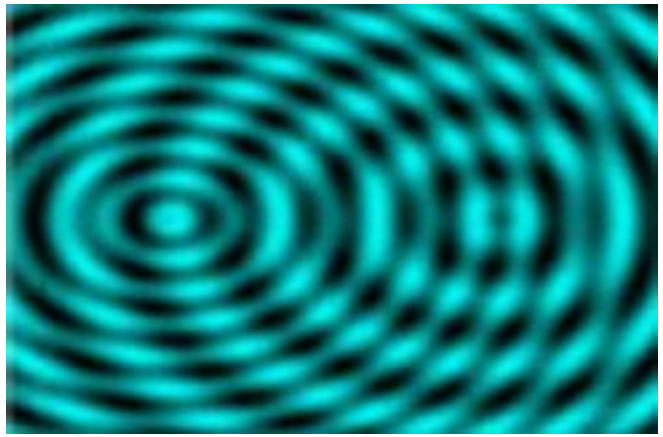

Millikan's oil-drop experiment (1909), obtaining an accurate value for the elementary electric charge carried by an electron.

1. Course background

Rutherford's gold foil experiment (1911), resulting in the discovery of the nucleus.

Young's double-slit experiment applied to the interference of single electrons (1961), confirming the wave nature of electrons.

2. Course objectives

"University Physics Experiments" is a compulsory course for all STEM majors across the university. It offers systematic training of experimental skills and experimental methodology for undergraduate students, with the following objectives:

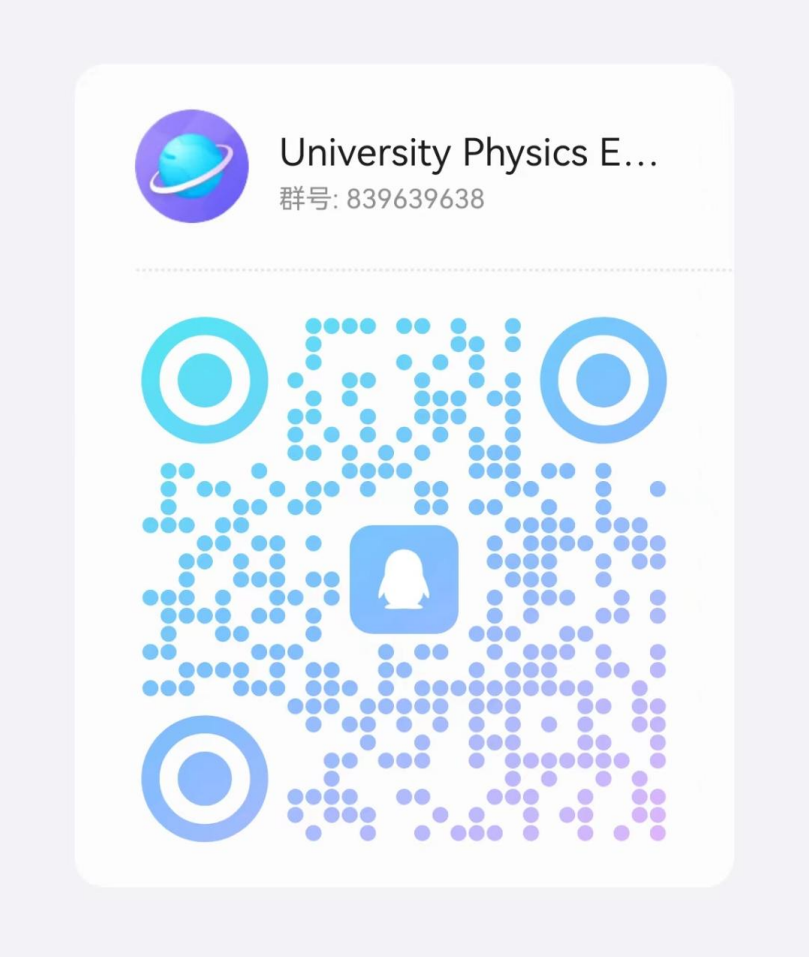

1. To equip students with basic experimental skills, a scientific mindset, and the ability to innovate.
2. To equip students with the ability to properly acquire, record and analyse experimental data using existing knowledge of physics.

3. Course contents - 1A, spring semester, 2025)

Experiment	Laboratory	Lecturer
I. Michelson interferometer	T5707	Rui ZHONG (钟瑞)
II. Young's Modulus of a Metallic Wire	T5808	Feng CAO (曹峰) / Sisi HE (何思斯)
III. Collision and Targeting Experiment	T5706	Boyi WANG (王博弋)/ Weijian ZHOU (周伟健)
IV. The Hall Effect	T5802	Fei YEN (晏飞翔)
V. Measurement of the Surface-Tension Coefficient of a Liquid	T5801	Yanshi HUANG (黄延实)
VI. Characteristics of RLC circuits	T2707	Xiaobin CHEN (陈晓彬)/ Weijian ZHOU (周伟健)
VII. Speed of Sound in Air	T5805	Ho-Kei CHAN (陈浩基) / Sisi HE (何思斯)

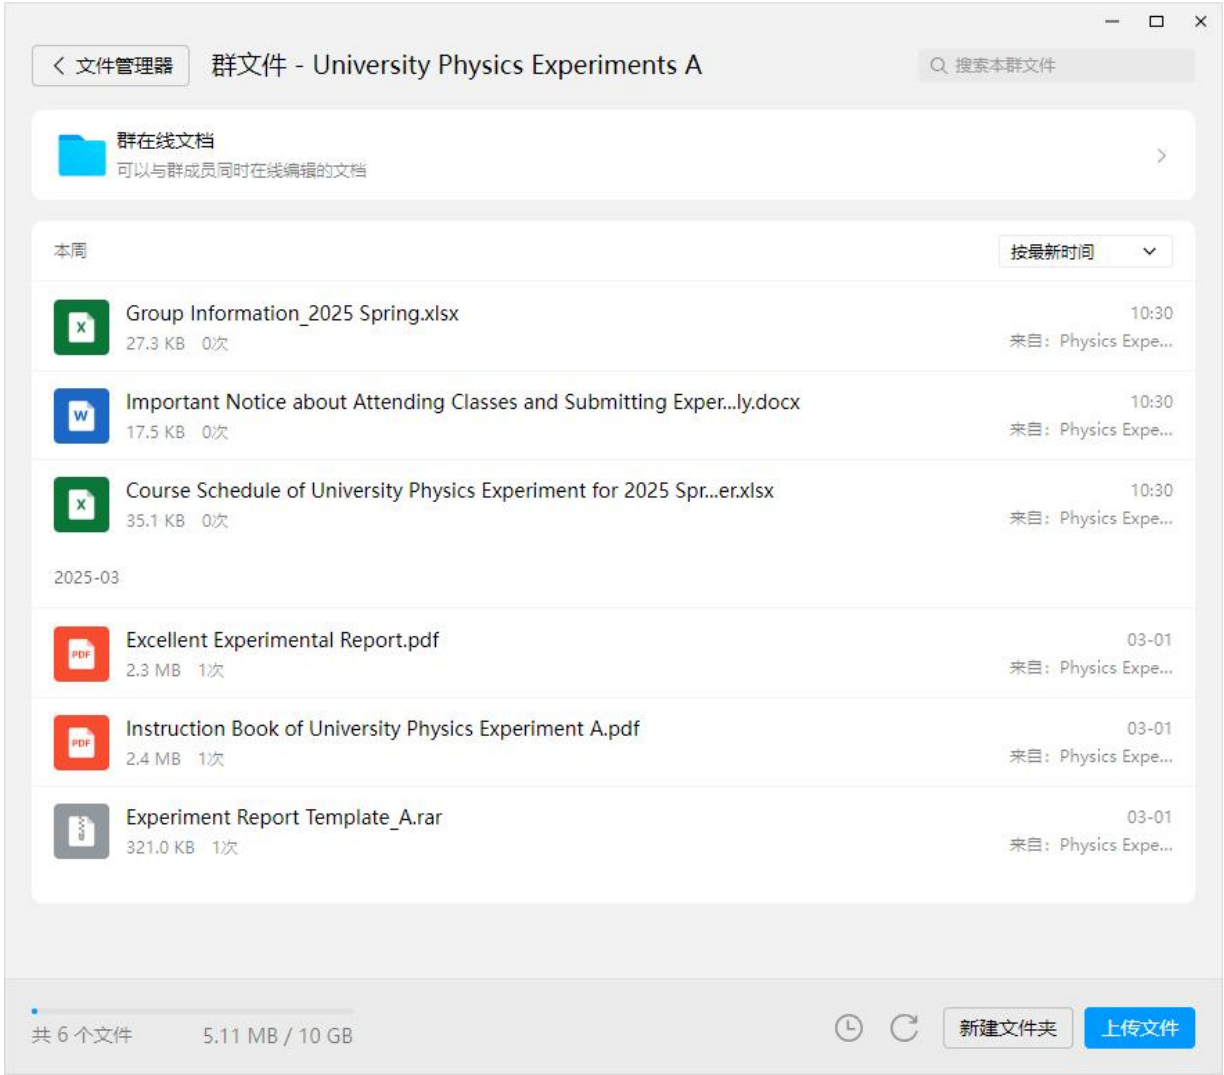

4. Course arrangements

QQ group (managed by Rui ZHONG)

4. Course arrangements

Important documents which you can download after joining the QQ group

4. Course arrangements - schedule for week 3 to week 16

Course Schedule of University Physics Experiment for 2025 Spring Semester

Note: Some classes start at **13:15** (Because the Department of Academic Affairs has not reserved enough time for class scheduling), be c

Week	Day	Date	Class	Time	Only for University Physics Experiment IA	For Both University Physics Experiment IA and IB					
					Michelson Interferometer (Room:T5707) Instructor: 钟瑞	Speed of Sound in Air (Room:T5805) Instructor: 陈浩基，何思斯	Characteristics of RLC Circuits (Room:T2707) Instructor: 陈晓彬，周伟建	Hall Effect (Room:T5802) Instructor: 晏飞翔	Young's Modulus of a Metallic Wire (Room:T5808) Instructor: 曹峰，何思斯	Collision and Targeting Experiment (Room:T5706) Instructor: 王博弋，周伟建	Measurement of the Surface-tension Coefficient of a Liquid (Room:T5801) Instructor: 黄延实
3	Monday	2025. 03. 10	Noon-5-6	13:15-15:45		A8		A12			
			5-6-7	14:00-16:30							
	Tuesday	2025. 03. 11	7-8-Nightfall	16:00-18:30							
	Friday	2025. 03. 14	Noon-5-6	13:15-15:45							
4	Monday	2025. 03. 17	Noon-5-6	13:15-15:45	A7		A9		A10	A11	A12
			5-6-7	14:00-16:30

5. Course requirements

Instruction booklet

Instruction Book of University Physics Experiment A

Table of Contents

Experiment I: Michelson Interferometer 1
Experiment II: Young's Modulus of a Metallic Wire 12
Experiment III: Collision and Targeting Experiment 17
Experiment IV: The Hall Effect 21
Experiment V: Liquid Surface Tension Coefficient Measurement 25
Experiment VI: Characteristics of RLC circuits 32
Experiment VII: Speed of Sound in Air 39

Each experiment:

1. Pre-lab
2. Objectives and Tasks
3. Principles
4. Set-up
5. Procedure
6. Precautions
7. Lab-report requirements

5. Course requirements

Lab-reports

Each experiment:	1. Pre-lab assignment	(2 marks)
	2. Data acquisition	(3 marks)
	3. Data processing	(3 marks)
	4. Data analysis	(1 marks)
	5. Discussion	(1 marks)

Total: 10 marks

As a prerequisite for each experiment, the pre-lab assignment must be completed in advance and then signed and marked by the lecturer in the begining of the laboratory class, for otherwise you will *not* be allowed to conduct your experiment.

5. Course requirements

Lab-reports

For each experiment:

1. Complete your pre-lab assignment and lab report using the template we provide.

2. Submit your lab report in pdf, within ONE week after your laboratory class (Submission link to be provided via the QQ group):

3. When submitting, fill in your name and student ID as well as the name of the experiment according to the system's requirements.

5. Course requirements

Lab-reports

3. Record the raw data on a separate sheet, and let the lecturer check your data and sign on the sheet.

4. Process your raw data right after the experiment, and present the corresponding details of data-processing in your lab report.

5. Data processing includes step-by-step calculations, estimations of errors and uncertainties, and graphical presentations of results.

6. Answer the questions in the dicussion section using existing knowledge of physics.

5. Course requirements

Laboratory discipline

For each experiment

1. You should arrive at the laboratory on time, ideally 15 minutes in advance. If you are late for more than 10 minutes, you will NOT be allowed to attend the laboratory class.

2. Upon arrival at the laboratory, take attendance, pick one set of equipment for your experiment, and let the lecturer mark your pre-lab assignment.

3. Upon completion of your experiment, tidy up your area before leaving the laboratory.

5. Course requirements

Laboratory discipline

4. Pay special attention to the precautions and safety measures advised by the lecturer.

5. Plagarism of lab reports and fabrication of experimental data are strictly prohibited. Once discovered, the corresponding lab report will be disqualified with a zero score, and you will fail the whole course.

6. If you cannot attend the laboratory class as scheduled, you can reschedule your slot in accordance with our course schedule.

7. To pass this course, you must have completed all 7 experiments and obtained an overall score of at least 60% of the total available marks.

6. Errors and uncertainties in measurements

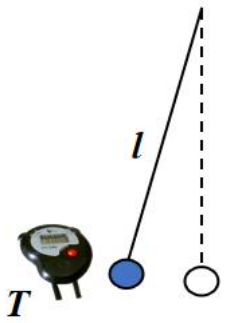

Measurements

A measurement is the comparison of an unknown quantity with a standard quantity (i.e. a unit).

A direct measurement is the direct comparison of an unknown quantity with a standard quantity, through the use of an instrument.

An indirect measurement is the evaluation of an unknown quantity through its mathematical relation with directly measured quantities. For example,

$g = (4\pi^2 l)/T^2$

6. Errors and uncertainties in measurements

Measured value A

True value A_0

Absolute error $\Delta A \equiv A - A_0$

Relative error $E \equiv (\Delta A/A_0) \times 100\%$

If the true value is approximated by the average value $\overline{A}$, we have

Absolute deviation $\Delta A \equiv A - \overline{A}$

Percentage error $E \equiv (\Delta A/\overline{A}) \times 100\%$

6. Errors and uncertainties in measurements

Systematic errors and random errors

Systematic errors, which arise from instrumental bias, environmental interference, procedural mistakes, or human errors, affect measurements in a uniform direction or manner, leading to biased results. Such errors can be minimised via an improved method of measurement, a properly modified empirical relation, or a proper calibration / set-zero of the instrument.

Random errors, which occur by chance or due to some unpredictable factors, affect measurements in a random manner. Such errors can be minimised by conducting a sufficiently large number of measurements such that the errors approach a normal distribution.

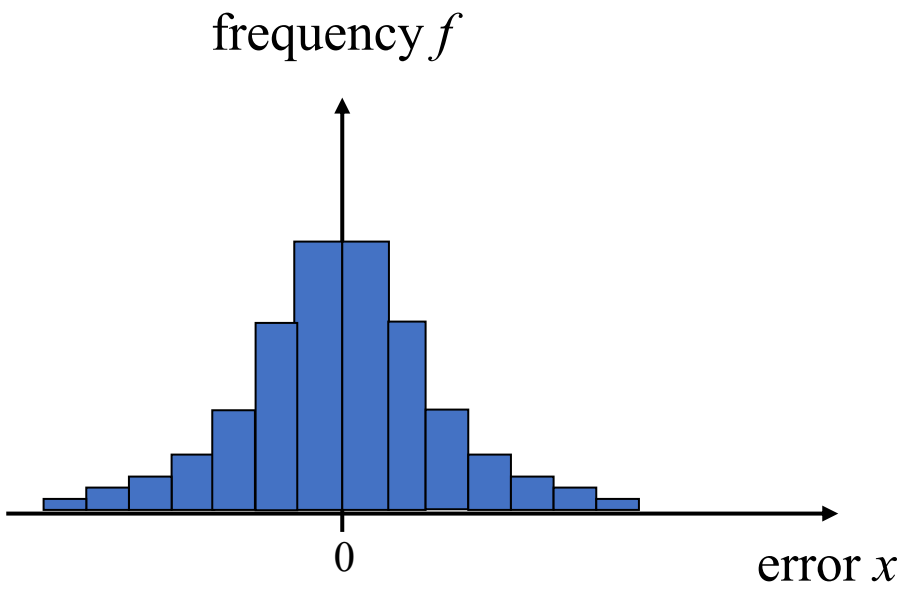

6. Errors and uncertainties in measurements

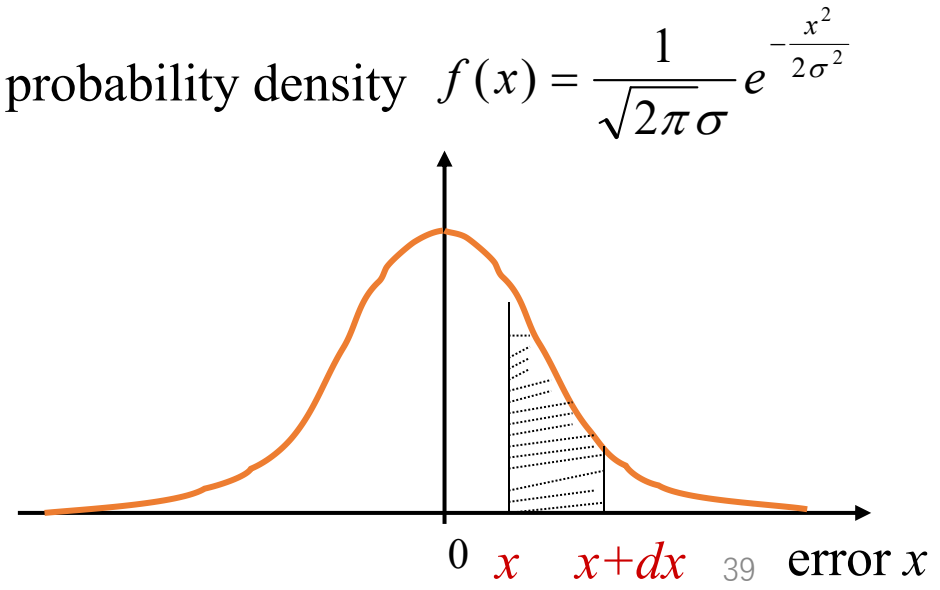

Distribution of random errors

For the ith measurement:

Random error $x_i = A_i - A_0$

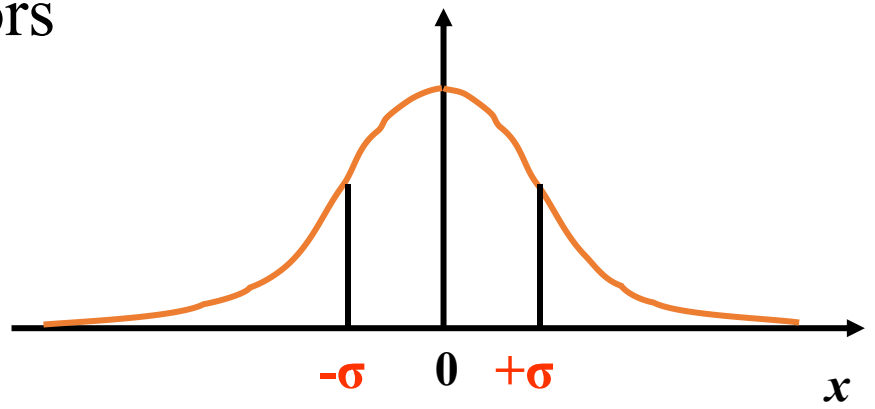

Approaching a normal distribution in the limit of infinite measurements:

6. Errors and uncertainties in measurements

Distribution of random errors

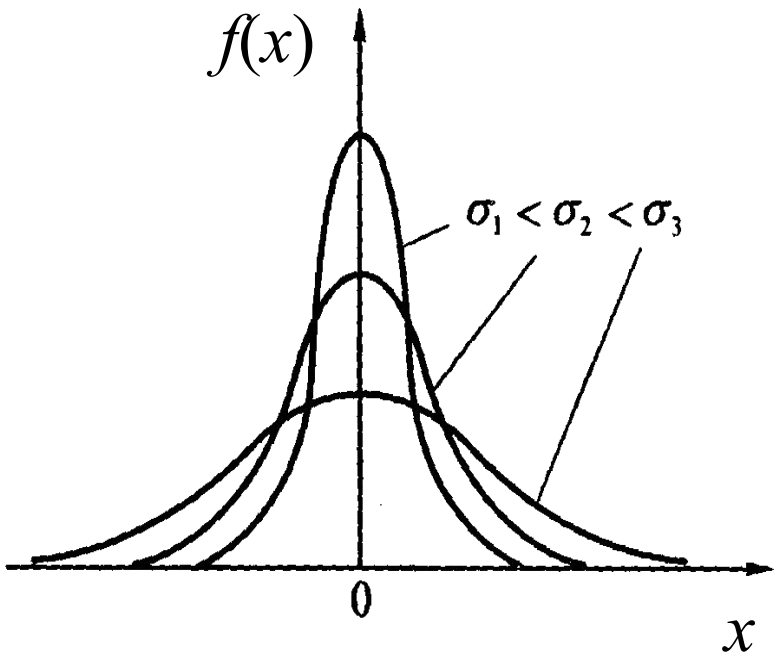

Standard error $\sigma = \sqrt{\frac{1}{n}\sum_{i=1}^{n}(A_i - A_0)^2}$

Confidence interval $[-\sigma,\sigma]$

Coverage probability / confidence level $P_{x\in[-\sigma,\sigma]} = \int_{-\sigma}^{\sigma} f(x)dx = 0.683$

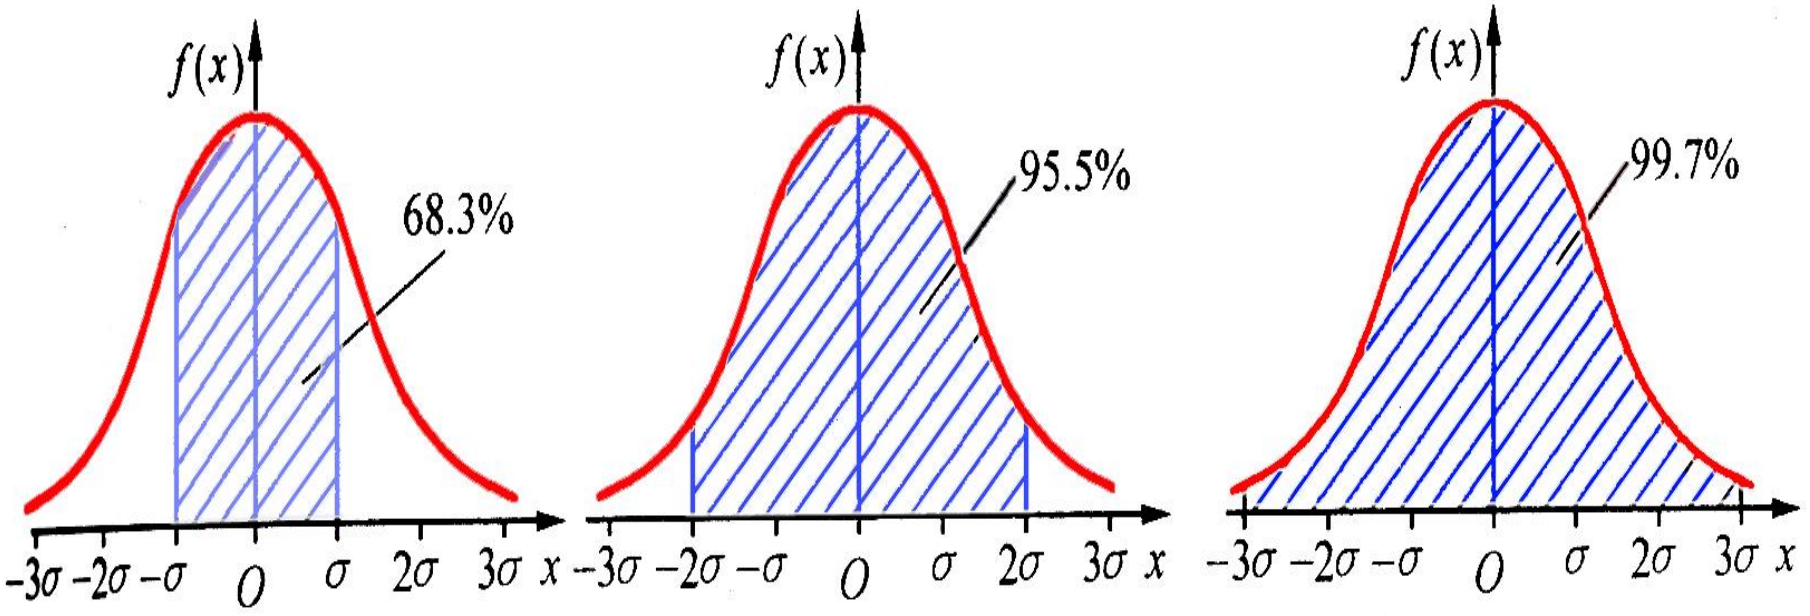

The greater the value of σ, the greater the the probability for the occurrance of large errors

6. Errors and uncertainties in measurements

Distribution of random errors

Confidence levels at various confidence intervals:

Assumptions: (1) Infinite number of measurements (which cannot be achieved)
(2) The true value A_0 is known (which is not the case)

6. Errors and uncertainties in measurements

Distribution of random errors

Approximation of the standard error $\sigma = \sqrt{\frac{1}{n}\sum_{i=1}^{n}(A_i - A_0)^2}$

for an infinite number of measurements and for an unknown value A_0

by the standard deviation $S = \sqrt{\frac{\sum_{i=1}^{n}(A_i - \overline{A})^2}{n-1}}$

for a finite number of measurements and for the corresponding average $\overline{A}$

(Bessel's correction: use of $n - 1$ instead of n)

6. Errors and uncertainties in measurements

Distribution of random errors

The average $\overline{A}$, which is obtained from a finite number of measurements, also exhibits random absolute deviations x’ about an average value.

Its standard deviation is given by

$$S' = \frac{S}{\sqrt{n}} = \sqrt{\frac{\sum_{i=1}^{n} (A_i - \overline{A})^2}{n(n-1)}}$$

Confidence level $P_{x' \in [-S', S']} = \int_{-S'}^{S'} f(x')dx' = 0.683$

6. Errors and uncertainties in measurements

Distribution of random errors

An uncertainty U refers to the numerical range $\overline{A} \pm U$ which a measured result falls within at a particular confidence level. Here we choose this probability to be equal to $P = 0.683$.

A type-A uncertainty is obtained from the statistical analysis of a series of measurements. For $P = 0.683$, it is given by

$$S_i \equiv S' = \sqrt{\frac{\sum_{i=1}^{n} (A_i - \overline{A})^2}{n(n-1)}}$$

6. Errors and uncertainties in measurements

Distribution of random errors

A type-B uncertainty, denoted here as S_j, is obtained by non-statistical means. Here we only consider type-B uncertainties due to the presence of instrumental errors $\Delta_{\text{instrument}}$:

$$S_j = \frac{\Delta_{\text{instrument}}}{C}, \quad \begin{cases} C = \sqrt{3}, \text{ uniform distribution of errors} \\ C = 3, \text{ normal distribution of errors} \end{cases}$$

Total uncertainty $U = \sqrt{S_i^{\,2} + S_j^{\,2}}$

6. Errors and uncertainties in measurements

Precision and accuracy

Accuracy refers to how close the measured results of an experiment are to the true value.

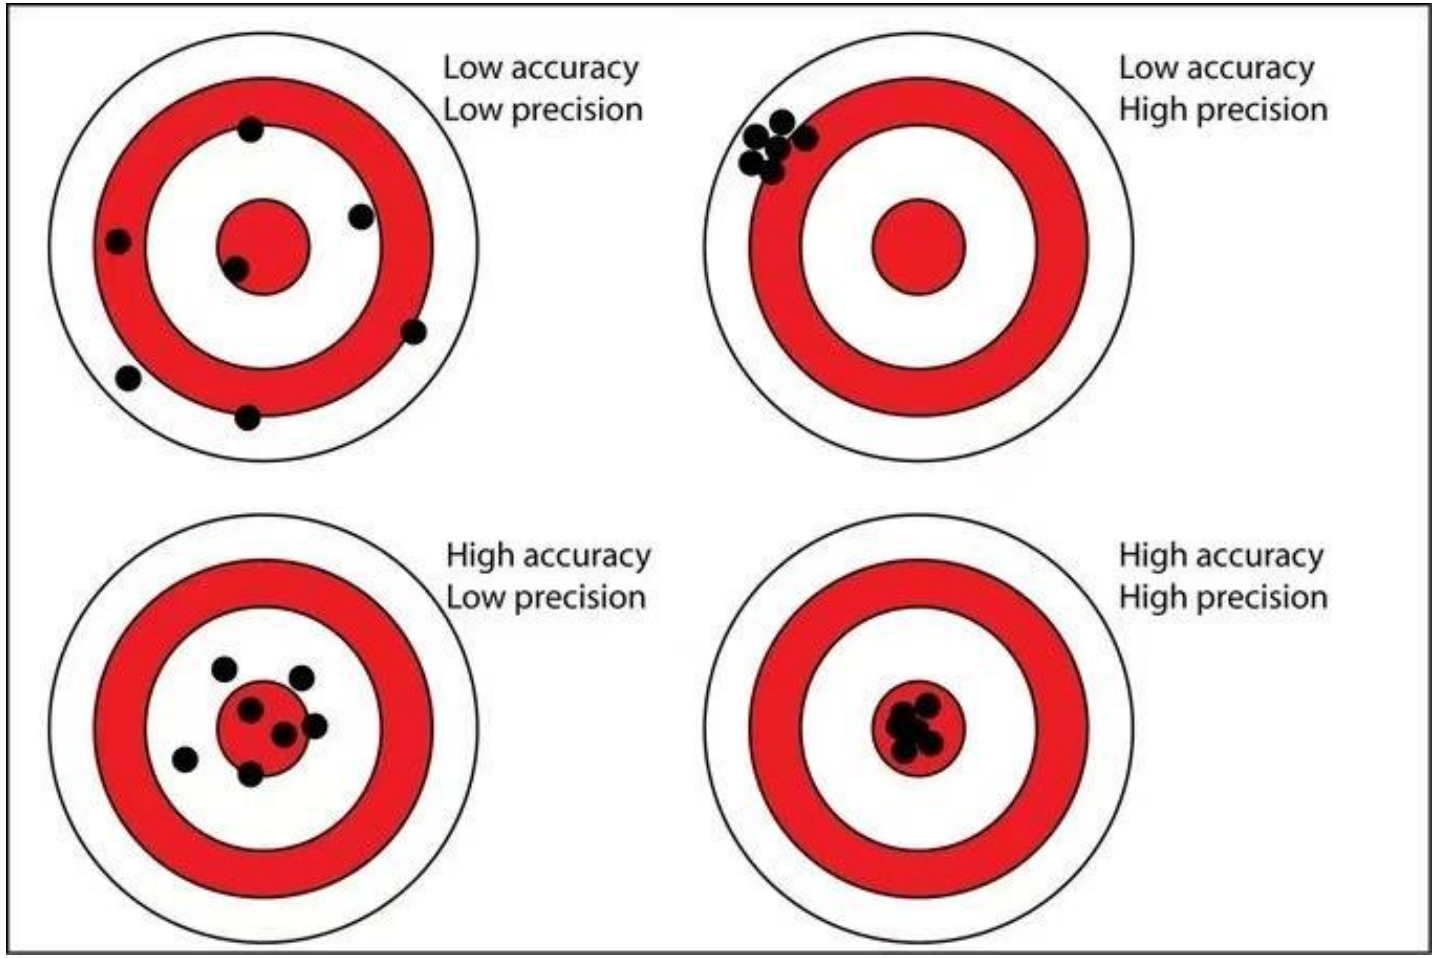

Precision refers to how close the measured results of an experiment are to one another.

A larger value of the standard error σ corresponds to a wider spread of data due to random errors and hence a lower precision.

Any systematic error shifts the whole set of data away from the true value, thus lowering the accuracy of the measurements.

6. Errors and uncertainties in measurements

Precision and accuracy

6. Errors and uncertainties in measurements

Presentation of experimental results

Results from a direct measurement: $A = \overline{A} \pm U$

$$\text{Percentage error } E = \frac{U}{\overline{A}} \times 100\,\%$$

$$\text{Confidence level } P = 0.683$$

Results from an indirect measurement:

Let B be an indirectly measured quantity that is related to the directly measured quantities $x_1, x_2, \cdots, x_m$ as follows:

$$B = f(x_1, x_2, x_3, \ldots, x_m)$$

6. Errors and uncertainties in measurements

Presentation of experimental results

Results from an indirect measurement: $B = \overline{B} \pm U$

Percentage error $E = \dfrac{U}{\overline{B}} \times 100\,\%$

Confidence level $P = 0.683$

where $\overline{B} = f(\overline{x}_1, \overline{x}_2, \overline{x}_3, \ldots, \overline{x}_m)$

For $x_i = \overline{x}_i \pm U_i \quad i \in [1, m]$, the overall uncertainty for B is given by

$$U = \sqrt{\left(\frac{\partial f}{\partial x_1}\right)^2 U_1^2 + \left(\frac{\partial f}{\partial x_2}\right)^2 U_2^2 + \cdots + \left(\frac{\partial f}{\partial x_m}\right)^2 U_m^2} = \overline{B}\sqrt{\left(\frac{\partial \ln f}{\partial x_1}\right)^2 U_1^2 + \left(\frac{\partial \ln f}{\partial x_2}\right)^2 U_2^2 + \cdots + \left(\frac{\partial \ln f}{\partial x_m}\right)^2 U_m^2}$$

7. Significant figures of measured quantities

The significant figures of a measured quantity refer to the set of digits required to express the quantity to the required degree of accuracy, starting from the leftmost non-zero digit and ending with a digit relevant to the resolution limit of the measurement. Here we use the following rules to determine the significant figures in a measured quantity:

1. Any non-zero digit is a significant figure. For example, the quantity 4.321 kg consists of four significant figures.

2. Any zero between two non-zero digits is a significant figure. For example, the quantity 90.05 kg consists of four significant figures.

7. Significant figures of measured quantities

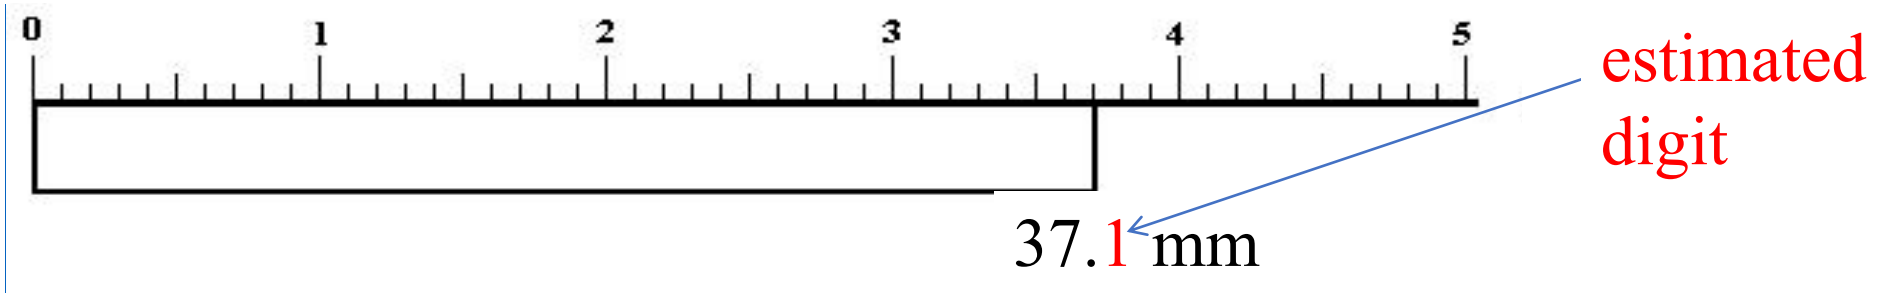

3. Any zero to the left of the first non-zero digit is *not* a significant figure. For example, the quantity 0.015 kg consists of two significant figures.

4. Any zero to the right of the rightmost non-zero digit is a significant figure. For example, the quantity 0.0450 kg consists of three significant figures.

5. Any zero to the right of the rightmost non-zero digit in an integer may or may not be significant, depending on the resolution of the measurement. For example, the quantity 10500 km consists of three significant figures if the resolution of measurement is 100 km, and it consists of five significant figures if the resolution of measurement is 1km.

7. Significant figures of measured quantities

6. Any directly measured quantity should be expressed up to the rightmost significant digit of the instrumental error, with the rightmost digit being an estimated value. For a ruler with a resolution of 1 mm, the instrumental error is about half of this resolution, i.e. around 0.5 mm, so that any measured length should be expressed up to the first decimal place:

7. For a voltmeter or an ammeter, the instrumental error is typically 0.5% of the chosen scale. For example, if the chosen scale of a voltmeter is 10 V, the instrumental error is around 0.05 V, and the measured voltage should be expressed up to the second decimal place.

7. Significant figures of measured quantities

8. For any measured quantity, the number of significant figures is independent of the position of the decimal point. For example, the quantity 10.50 mm can equivalently be written as 1.050 cm (but *not* 10500000 nm).

9. The uncertainty of any measured quantity should be expressed with only one or two significant figures. For example, if the computed value of an uncertainty is 0.05106, it should be rounded up to a single significant figure as 0.06. If the leftmost significant figure is 1 or 2, e.g. 0.02135, it should be rounded up to two significant figures, e.g. 0.022.

10. The calculated value of any indirectly measured quantity should be rounded off to the rightmost significant digit of the corresponding uncertainty, according to the following rules for rounding:

7. Significant figures of measured quantities

If the digit one step to the right from the rounding digit is 0, 1, 2, 3, or 4, round down. For example, the number 5.76433 is rounded to four significant figures as 5.764.

If the digit one step right from the rounding digit is 6, 7, 8, or 9, round up. For example, the number 5.76473 is rounded to four significant figures as 5.765.

If the rounding digit is an odd number and the digit one step right from the rounding digit is 5, round up. For example, the number 5.76353 is rounded to four significant figures as 5.764.

If the rounding digit is an even number and the digit one step right from the rounding digit is 5, keep the rounding digit unchanged. For example, the number 5.76453 is rounded to four significant figures as 5.764.

7. Significant figures of measured quantities

In general, the accuracy of a calculated result is limited by the least accurate measurement involved in the calculation.

In addition and subtraction, the result should be rounded off to the rightmost common significant digit among all components. For example, 100 + 23.643 = 123.643, which should be rounded to 124.

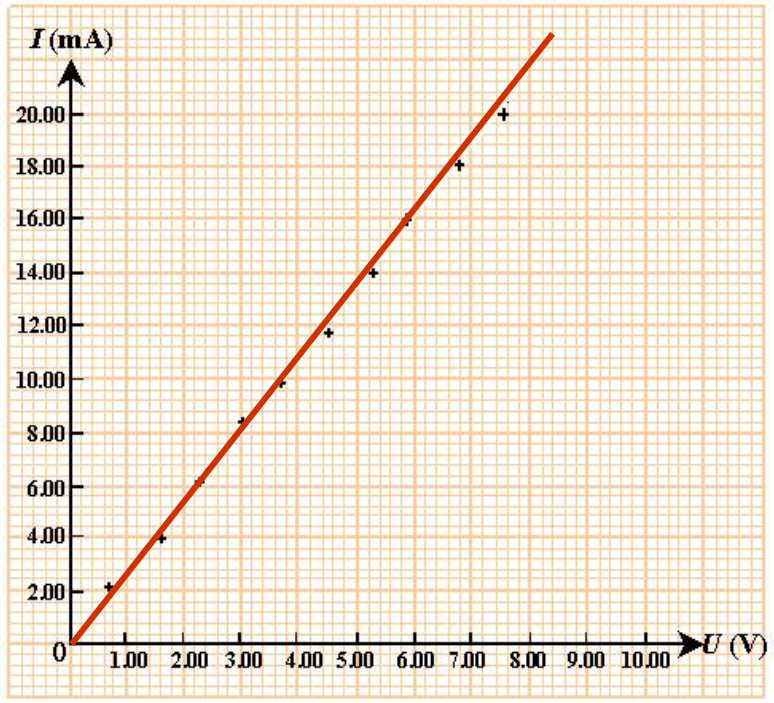

In multiplication and division, the result should be rounded off so as to have the same number of significant figures as in the component with the least number of significant figures. For example, 3.0 (with two significant figures) × 12.60 (with four significant figures) = 37.8 (with three significant figures), which should be rounded off to 38 (with two significant figures).

8. Methods of data analysis

1. Tabulation of data

$U\,(V)$	0.74	1.52	2.33	3.08	3.66	4.49	5.24	5.98	6.76	7.50
$I\,(mA)$	2.00	4.01	6.22	8.20	9.75	12.00	13.99	15.92	18.00	20.01

2. Graphical representation of data

8. Methods of data analysis

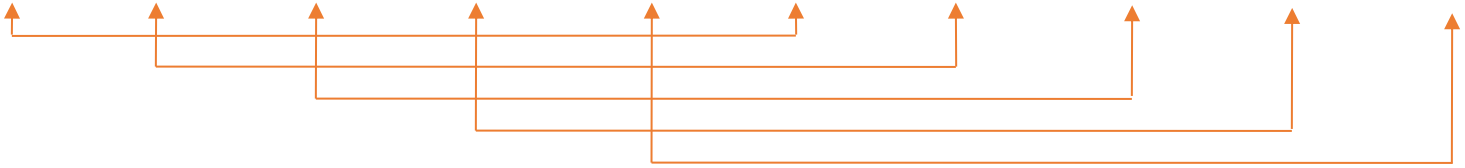

3. Method of successive differences:

Assume $y = kx + b$ with a total of $2N$ data points of x at regular spacings, and assume that the measurement errors of x are negligible. The slope k can be computed from the equation

$$k = \frac{1}{N}\sum_{i=1}^{N}\left(\frac{y_{i+N} - y_i}{x_{i+N} - x_i}\right)$$

Example:

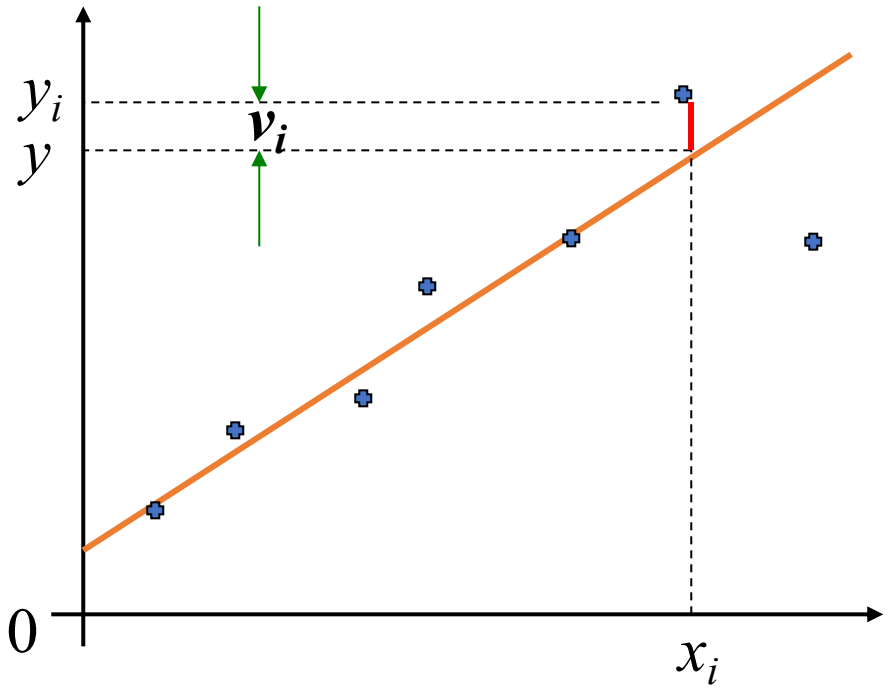

Voltage (V)	**0.00**	**1.00**	**2.00**	**3.00**	**4.00**	**5.00**	**6.00**	**7.00**	**8.00**	**9.00**
Current (mA)	**0.00**	**0.50**	**1.02**	**1.49**	**2.05**	**2.51**	**2.98**	**3.52**	**4.00**	**4.48**

8. Methods of data analysis

4. Method of least squares

Let $y = kx + b$

$$v_i = y_i - y = y_i - (kx_i + b)$$

$$\sum_{i=1}^{n} v_i^2 = \sum_{i=1}^{n} [y_i - (kx_i + b)]^2 = \min$$

$$\Rightarrow \begin{cases} \dfrac{\partial}{\partial k}\left(\sum_{i=1}^{n} v_i^2\right) = 0 \\ \dfrac{\partial}{\partial b}\left(\sum_{i=1}^{n} v_i^2\right) = 0 \end{cases} \Rightarrow \begin{cases} k = \dfrac{\overline{x}\,\overline{y} - \overline{xy}}{\overline{x}^2 - \overline{x^2}} \\ b = \overline{y} - k\overline{x} \end{cases}$$

Correlation coefficient $r = \dfrac{\overline{(xy)} - \overline{(x)}\,\overline{(y)}}{\sqrt{(\overline{x^2} - \overline{x}^2)(\overline{y^2} - \overline{y}^2)}} \in [-1, 1]$
