Environmental Psychology

Lecture two

Environments: nature & built

Part One

- Nature Environment
- Built Environment
- Architecture

Part Two

- Neighborhood
- City

Part One

- Nature Environment
- Built Environment
- Architecture

Natural Environment

- Natural environment encompasses all living and non-living things occurring **naturally**.
- Natural environment encompasses the ***interaction*** of all living species.
- The concept of the natural environment can be distinguished by components:

  Complete ecological units that function as natural systems without massive ***human intervention*** including all vegetation, microorganisms, soil, rocks, atmosphere and natural phenomena that occur *within their boundaries*.

- Universal natural resources and physical phenomena that *lack clear-cut boundaries*, such as air, water, and climate, as well as energy, radiation, electric charge, and magnetism, not originating from human activity.

- Human comes from natural environment. Naturally, human are fond of nature.
- People have believed for a long time that nature is good for them.

Natural environment – 1 (water, air, color, tree, hill)

Natural environment – 3 (tree, color, what else)

Human activity???

Built Environment

- The term built environment refers to the human-made surroundings that provide the settings for human activity, ranging in scale from personal shelter and buildings to neighborhoods and cities that can often include their supporting infrastructure, such as water supply or energy networks. The built environment is a material, spatial and cultural product of human labor that combines physical elements and energy in forms necessary *for living, working and playing*.

- In practice, the term "Built Environment" is typically used to describe the interdisciplinary field which addresses the design, construction, management and use of these man-made surroundings as an interrelated whole as well as their relationship to human activities over time (rather than a particular element in isolation or at a single moment in time). The field is generally not regarded as a traditional profession or academic discipline in its own right, instead drawing upon areas such as **economics, law, public policy, management, design, technology, and environmental sustainability**.

A road, fence, building (color, weather, and???)

Buildings (on a cliff?) near the sea

Royal garden (activity?)

Royal park (activity?)

Cars on road (noise???)

Built environment on a small hill

Island, Building, Prison??? far away city

Foreground element, background buildings

Built Environment

The built environment is a material, spatial and cultural product of human labor that combines physical elements and energy in forms necessary *for living, working and playing.*

From shelter to building, from building to architecture

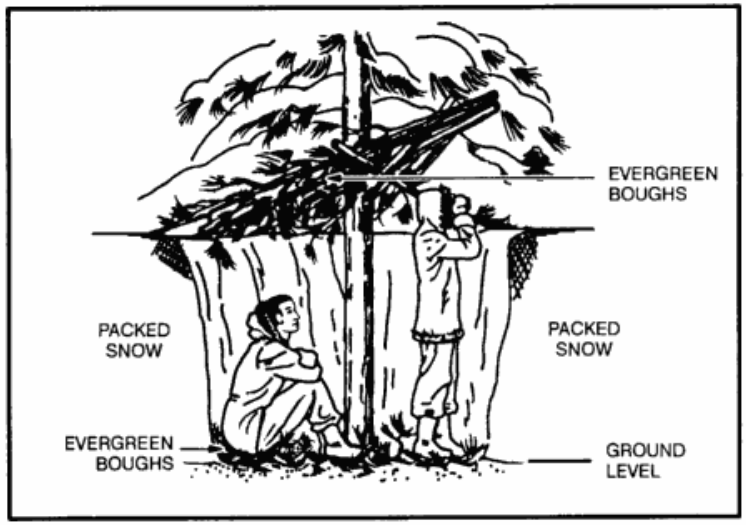

Figure 5-12. Tree-pit snow shelter.

Architecture or Building

- **Architecture** (Latin *architectura*, from the Greek ἀρχιτέκτων – arkhitekton, from ἀρχι- "chief" and τέκτων "builder, carpenter, mason")
- The art and science of designing and erecting buildings and other physical structures.
- The practice of an architect, where architecture means to offer or render professional services in connection with the design and construction of a building, or group of buildings and the space within the site surrounding the buildings, that have as their principal purpose human occupancy or use – profession.
- A general term to describe buildings and other structures.
- A style and method of design and construction of buildings and other physical structures.

- **Architecture means to offer or render professional services in connection with the design and construction of a building, or group of buildings and the space within the site surrounding the buildings, that have as their principal purpose human occupancy or use – profession.**

Part Two –built environment

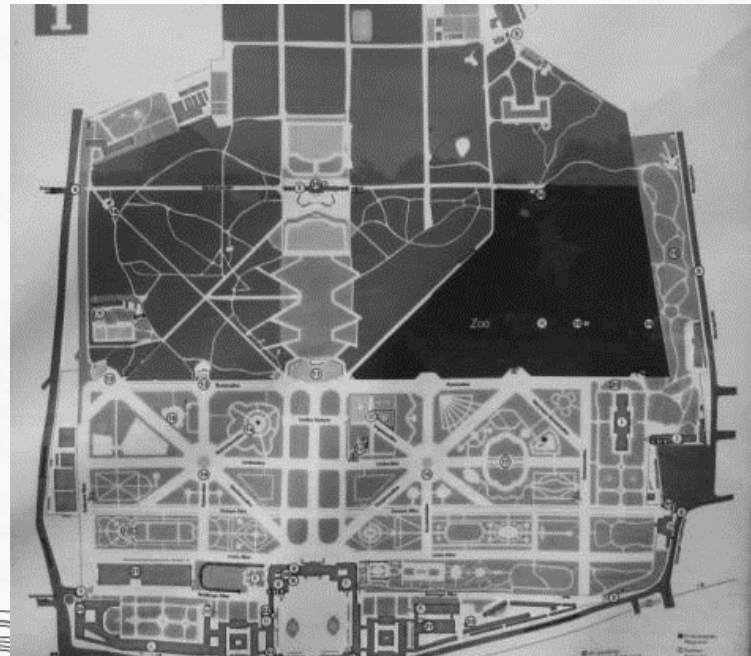

- Neighborhood
- City

Neighborhood

- A neighborhood is a geographically localized community within a larger city, town or suburb. It is generally defined spatially as a specific geographic area and functionally as a set of social networks.

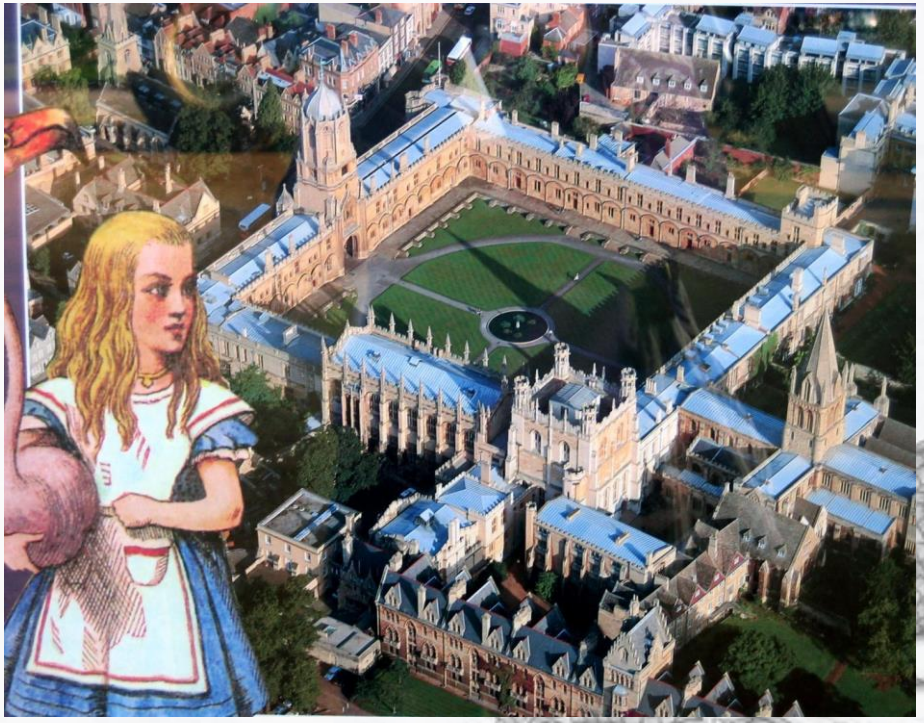

- Neighborhoods are typically generated by social interaction among people living near one another. In some preindustrial urban traditions, basic municipal functions such as protection, social regulation of *births and marriages, cleaning and upkeep are handled informally* by neighborhoods and not by urban governments; this pattern is well documented for historical Islamic cities.

- Neighborhoods are the spatial units in which face-to-face social interactions occur - the personal settings and situations where residents seek to realize common values, socialize youth, and maintain effective social control.

- Although not everyone agreed where the boundaries were, most did think their neighborhood had boundaries. With these boundaries, neighborhoods may be urban or suburban; may contain industrial, commercial, and/or residential development; may have undeveloped areas and/or developed parks; may be old or new, graced with quiet tree-lined streets or split by major roads, and will include varying percentages of high-rise, low-rise, single-family, and mobile homes as residences.

- Is there much or little face-to-face interaction in my neighborhood? - social interaction
- To what extent do the residents think of themselves as being of or from this neighborhood? - symbolic interaction
- Is there much or little contact between residents of this neighborhood and residents of other neighborhoods? - Attachment

City Square, Sheffield

City

- A city is generally an urban settlement with a large population.

- A city is a relatively large and permanent settlement. Although there is no agreement on how a city is distinguished from a town, many cities have a particular administrative, legal, or historical status based on local law.

- A city generally has advanced systems for sanitation, utilities, land usage, housing, and transportation. The concentration of development greatly facilitates interaction between people and businesses, benefiting both parties in the process.
